## DETAILED ACTION

### *Response to Arguments*

1. Applicant's arguments, see amendment, filed 4/26/2005, with respect to claims 31 and 47 are persuasive. However, upon further consideration, a new ground of rejection of claim 47 is made in view of Sato et al (US 5,861,915) and Takashima et al (US 5,596,366).

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claim 47 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sato et al (US 5,861,915) in view of Takashima et al (US 5,596,366).

Regarding claim 47, Sato discloses an image sensing optical system (Fig. 1) which attached to an image sensing apparatus (a video camera) having an image sensing element (a CCD in the camera, see col. 1, lines 5-11 and col. 8, lines 62-67), comprising:

a plurality of lenses (22p, 22y shown in Fig. 1, col. 9, lines 4-17 and note that glass plates are considered as lenses);

a memory that stores an adjustment amount (i.e., K1, K2, K3) used to correct a tilt (Fig. 1) of an optical axis of the image sensing optical system with respect to a reference plane to have

a predetermined relative state (see Fig. 1; col. 5, lines 40-51 and col. 7, lines 38-67, wherein “a reference plane” is inherent in order for the correction of vibration to function as disclosed);

a temperature sensor (41; Fig. 1);

wherein said memory stores an adjustment amount for each of a plurality of temperatures (see col. 7, lines 38-67).

Sato does not explicitly teach that the image sensing optical system is detachably attached to the image sensing apparatus. However, as taught by Takashima, an image sensing optical system (46) which includes a shake correction system utilizing active angle prism is detachably attached to a video camera as a well-known interchangeable optical system for sensing and correcting image vibration caused by hand shaking (see Fig. 1; col. 6, lines 20-34).

Therefore, it would have been obvious to one of ordinary skill in the art to combine the teachings of Sato and Takashima to construct an interchangeable image sensing optical system having a shake correction function so that the optical system would be detachably attached to a plurality of video cameras for image stabilization.

### *Allowable Subject Matter*

3. Claim 31 is allowed.

The following is an examiner's statement of reasons for allowance:

Regarding claim 31, the prior art of record also fails to teach or fairly suggest the *combination of all limitations* required in claim 31 that includes “...wherein the image sensing system has a **first memory that stores an adjustment amount used to correct a tilt of an optical axis of the image sensing optical system with respect to a reference plane, and a**

Art Unit: 2615

second memory that stores an adjustment amount used to correct a tilt of the image sensing element with respect to a reference line, and upon the adjustment, the adjustment amounts are read out from the first and second memories, **the readout adjustment amounts are merged, and adjustment is done using the merged adjustment amount.**"
